Create a folder called todo_app
In this folder create one backend folder and one frontend folder
Save TAMID_frontend and TAMID_backend to their respective folders
Open command window and type: cd OneDrive\todo-app\backend
Then type python TAMID_backend.py
Now the backend should be running
Double click to open the TAMID_frontend.html file for the frontend

I used chat gpt for this and based it off the python code I wrote completely on my own which I also included in the git hub as TAMIDapp.py. I am very proficient in python but am still learning about java and html so I wanted to also show you my full capabilities in python without having to add the frontend.
